

4.2 Kit for bonding unit type LKE 300 T / 300 VT

Kit for bonding unit for installation into test stations, test systems, etc. Extended version with 3-8 bonding modules (special versions with max. 32 modules). Suitable for single lines with tinned ends, wire-end sleeves, flat-blade connections. Special versions are also available for not bared line ends.

The bonding unit is equipped with bonding modules of the **LKV-12** model series in a grid size of 15 mm. The individual components are connected using a terminal strip or a SUB-D socket connector. A compressed air connection, NW 3 mm completes the unit. The kit contains all the individual parts required to manufacture a complete bonding unit ready for connection.

The **LKE 300 T** version is equipped with a pneumatic central opening button. This allows opening manually all bonding modules at the same time when the test process has been finished.

The **LKE 300 VT** version includes magnetic valve and central open button. The signal „Test finished-sample Ok“ interrupts the magnetic valve supply (24V=) and opens all bonding elements. The test sample can be removed. In case of an error message, the modules remain closed and the bonding can only be opened using the central opening button.
